Should Software Resource be free to share to others?

Daily life cannot be easy or go smooth without technology. Modern days, it is not an exaggeration at all that human beings are depending their daily life on technology. Especially, IT, which stands for industrial technology is a very huge portion of nowadays technology. In IT, hardware and software are main two different groups. In here, there are no such thing whether hardware or software is more important because greater device and system would be performed as they cooperate together as one. To understand easily, software is simply developed with programming and many different company can come up with same idea of software for their product, which cause an ownership confliction. In my opinion, creator or developer should have the ownership, but software resource should be free to share to others.

The reason why the ownership should be necessary is because IT may accelerate for the better future in the way of more convenient life style. For example, in cellular phone industry, people can pick out so much technology in common among the companies, Samsung, LG, Apple, and so on. At the same time, individual of companies are competing with their IT skill every single day. Toshiba is the first company that brings up the fingerprint sensor system as a part of smartphone function. Of course this become a big issue especially to other IT companies who deals with smartphone mainly because they are in competition in the field area. Since innovational technology has now launched, other company would more focus on how to improve its skill from the original software. By earning an ownership, creator or developer may

feel a great accomplishment and get credit in IT field as a huge contribution that may change the whole world.

Also, by owning an ownership is also a great way to raise up their marketing as the first company that come up with brilliant idea. And people would give some attention to the company, especially more if it is a new start-up company, and may invest their money or at least some interest for the company's future. To obtain people's attention and ownership, company will try hard to bring up a new software to enforce in different feature. Regardless of size of companies, if they set their goal to earn an ownership of the new launching software, speed flow in IT field will be faster which leads a faster movement in society.

The reason why software resources should be free to share despite it has a specific owner is because for improvements as a community. Having an ownership definitely will help them to gain so much respects from others. Other people or business would like to take a look at the software and see if there is anything they would like to add or make any modification to make it much more useful or efficiently for end users. Since it belongs to an owner, business that used the idea will have to give a credit where they got the source. However, since other business can access to the source, the base software may get so much feedback and these can lead to brilliant project that can change end user's life style in better way. These little feedback will gather and gather, and eventually people will settle down with the best result out of all.

In conclusion, people or businesses getting software idea or software resources for free is fair as long as the ownership is issued. Even when people have to give a credit about their words or statement that is originally from other people's mouth. Applying the same principle in IT field, citing the ownership while people are using it for free should not be the problem.
